

Interplanetary United Nations: Moons Revault

Introduction

Hello! And welcome to iMUNC's second conference. In this committee delegates will have to discuss the morals, social, political and economical aspects in a futuristic setting where planets' moons have started to revolt, all while staying in character with their given planet/moon. This will be a challenging committee and we are looking forward to all your wonderful and innovative ideas.

In the year 2500 humanity started to become overpopulated. The head of Bill Nye, also the president of the United States of Science, calculated how long the Earth had before the population exceeded the world's resources. Fearing the end date was soon, Nye went on a diplomatic mission to gather funding to create colonies on other planets. For the next 500 years all the countries and colonies on Earth banded together to begin the creation of an interplanetary transport system. Many attempts were made by the people of Earth. Most failed miserably, many died in the pursuit of planetary expansion. After years of trial they made it to Jupiter on January 1st 2700. They started terraforming immediately. By 2800 all planets had started to be terraformed. Jupiter was a flourishing planet and the model for every other Planet in the solar system. Earth was finally back down to a sustainable population.

By the year 3000 we terraformed every planet in the solar system to accommodate our ever growing populations. However space travel is expensive and someone needed to fund the expeditions. Private companies stepped in seeing a way to exploit the natural resources of the planets. They took control and implemented their own governments on the planets. After centuries of exploitation, groups of workers started migrating to the moons.

They settlers sought freedom from the governments that ran their planets. They thought they had achieved their goals, but the governments went after them. Installing peacekeepers and diplomats on every moon they controlled. Not all planets did this however. The Earth had given its moon freedom very early on declaring it it's own entity. The moons had no choice but to live under the thumb of their planet's government. The governments got progressively worse throughout the centuries. Implementing laws and taxes that only benefited the elite.

It is the year 3100. The new century has just started and with it a new set of problems. The moons have started to fight back against the planets that they belong to. They are determined to gain their independence at any means necessary. The planets are trying to defuse the situation without violence. The moons are ready for war. As delegates you must find a solution to this interplanetary issue.

Mercury

Mercury having no moons gets most of their resources from other planets and their moons. They stay impartial as to not inflate the conflict already starting.

Venus

Venus also has no moons and remains impartial like Mercury. The planet is reliant on other planet's help to keep being sustainable.

Earth

Earth gave their moon freedom very early on in the planetary expansion. They have a very good relationship and are the model for other planets. Earth is the scientific capital of the solar system and is relied upon by other planets and moons as a source of technology and medicine.

Earth has the power to control the pharmaceutical supply to the rest of the planets.

Luna (Earth's Moon)

Luna works in tandem with Earth to support both their economies. The moon does not have many resources but after terraforming has been used as a arboretum for saving different tree species.

Mars

Mars has had a rough relationship with their moons over the years. The moons were terraformed for the sole purpose of iron ore mining. Mars takes great advantage of Deimos and Phobos. The workers are exploited and have very low quality of life.

Deimos (Mars' Moon)

Since Deimos is a mining moon it has very little political structure and is run by Mars appointed representatives. Deimos has been secretly preparing for war for years now and is one of the top moons in the fight for freedom.

Phobos (Mars' Moon)

Phobos is a mining moon. The miners on Phobos have perfected their mining techniques and are extremely efficient at what they do. Because of this they are treated fairly well by Mars and have plenty of representation. They are invaluable to the Mars economy.

Jupiter

Being the first planet terraformed it is far more advanced than other planets and moons. It is the trade capital of the solar system. Every piece of commerce traded between planets must go through Jupiter for inspection. They are for moons having their freedom.

Jupiter has the power to control interplanetary trade.

Jupiter's Moons

Jupiter's moons formed a collective. They all want freedom from Jupiter and are expected to get it within the next few years. They have a very good economical relationship with Jupiter and are treated as equals. They are for moon's independence.

Saturn

Saturn is a gas planet that controls most hydrogen production used for space travel. They are one of the most important planets in the solar system. They are against moons obtaining freedom since they exploit most of their moons for cheap production labor. Saturn is ready to go to war to continue their reign over their moons.

Saturn's Moons

Like Jupiter's moons, Saturn's moons formed a collective to try and win their independence. They are heavily taxed with very little representation. They have been trying to find a diplomatic way to fight against their oppression. So far they have been shut down every time. They are gearing up for war.

Uranus

Uranus is a complicated planet to live on. There are many problems with the environment that terraforming could not fix. The main one being diamond rain. All buildings are extremely reinforced to resist diamonds destroying them. Uranus exports diamonds to every mining moon in the solar system and has good relations with all of them. They remain an impartial party but can be swayed.

Uranus' Moons

Uranus' moons formed a collective to make it easier to negotiate with Uranus. They did this very early on but haven't had a hard time negotiating in years. They are treated very well by Uranus and are given representation on every matter. They do not want freedom and are happy with the way that they are living.

Neptune

Since Neptune has very powerful winds their main export is electricity. Their entire planet is run off of wind turbines and they produce enough energy to support the entire solar system. The planet itself is made up of extremely wealthy families that own the wind turbines and make their money off of that. They are the top 1% of the entire solar system. They exploit the moon for cheap labor. They are against moons' freedom.

Neptune's Moons

Another collective of moons that banded together for strength. They are treated terribly by Neptune and are heavily exploited for labor. Neptune's Moons have started planning a war against Neptune for their freedom. They will go to war if the conflict is not settled.

Pluto

Pluto is an impartial planet that has no say in any solar system matters. The inhabitants are reliant on other planets for their resources more than any other planet. They contribute nothing besides a place for people to live.
